

DISCLAIMER — Financial Portfolio Intelligence System Project Documentation
Effective Date: May 31, 2026

For Educational and Informational Purposes Only. This presentation, including all associated materials — the Pre-Market PDF Report, Interactive Portfolio Dashboard, trade simulation data, trading plan, and any related documentation — is provided solely for educational and informational purposes. Nothing contained herein constitutes financial advice, investment advice, trading advice, or a recommendation to buy, sell, or hold any financial instrument. Not a Licensed Financial Advisor. The analysis, trade ideas, bias scores, and portfolio strategies presented in this material were generated using artificial intelligence tools and do not represent the views or recommendations of a registered investment advisor, broker-dealer, commodity trading advisor (CTA), or any other licensed financial professional. Always consult a qualified financial advisor before making any investment or trading decisions. Simulated Performance is Not Indicative of Future Results. The trade log, equity curves, ROI figures, and portfolio statistics shown in this presentation are based entirely on simulated data generated through a statistical model. Simulated or hypothetical performance results have certain inherent limitations: they do not reflect actual trading, they do not account for slippage, bid-ask spreads, brokerage commissions, margin requirements, overnight financing costs, or market impact. Actual results will differ materially from simulated results. Past Performance Does Not Guarantee Future Results. Even where reference is made to actual historical market conditions (price levels, yield data, technical indicators as of May 2026), the application of any strategy to those conditions in hindsight does not guarantee that the same strategy will produce profitable results going forward. Futures Trading Involves Substantial Risk of Loss. Trading futures contracts — including equity index futures (ES, NQ, YM), metals futures (GC, SI), energy futures (CL, NG), and Treasury futures (ZB, ZN, ZF) — involves a high degree of risk and is not suitable for all investors. The use of leverage can work against you as well as for you. You could lose more than your initial investment. Only risk capital you can afford to lose entirely. No Guarantee of ROI Target. The >20% annual return on investment target referenced throughout this presentation is a stated goal, not a guaranteed outcome. Market conditions, execution quality, individual discipline, and unforeseen events will all affect actual performance. There is no assurance that any strategy described herein will achieve its stated objectives. AI-Generated Content. This material was produced with the assistance of Claude, an AI system developed by Anthropic. AI-generated analysis may contain errors, omissions, or outdated information. All data, price levels, and technical analysis should be independently verified before use in live trading. No Liability. The author, presenter, and any affiliated parties accept no liability for any losses, damages, or costs arising directly or indirectly from the use of, or reliance on, any information contained in

this presentation.

FINANCIAL PORTFOLIO INTELLIGENCE SYSTEM — PROJECT DOCUMENTATION

Built with Claude (Cowork Mode) | Session Date: May 31, 2026

Portfolio: \$100,000 | ROI Target: >20% | Contracts: ES, NQ, YM, GC, SI, CL, NG, ZB, ZN, ZF

1. PROJECT OVERVIEW

This project was built entirely through conversational prompting in Claude's Cowork mode — no manual coding, no spreadsheet setup, no external tools. Starting from a single portfolio management request, three interconnected deliverables were produced in one session:

- A. Pre-Market PDF Report — a daily 3-page intelligence briefing for US futures traders
- B. Interactive HTML Dashboard — a 5-page portfolio monitoring and ROI tracking system
- C. This Documentation — a structured record of the full workflow

The system covers 10 futures contracts across 4 sectors:

- Equities: ES (S&P 500 E-Mini), NQ (Nasdaq 100 E-Mini), YM (Dow Jones E-Mini)
- Metals: GC (Gold), SI (Silver)
- Energy: CL (Crude Oil WTI), NG (Natural Gas)
- Bonds: ZB (30-Year T-Bond), ZN (10-Year T-Note), ZF (5-Year T-Note)

The goal: give a \$100K portfolio trader a repeatable, data-driven framework to target >20% annual ROI, with daily pre-market briefings, simulated trade logging, and a live dashboard for continuous strategy refinement.

2. DATASETS USED

All data was gathered through live web searches performed during the session. No historical data files or APIs were manually imported. Claude searched, synthesized, and embedded the following:

2.1 Real-Time Futures Prices (May 31, 2026)

- ES: 7,595 (ATH 7,592 hit May 29, 2026)
- NQ: ATH territory, leading +1.22% overnight
- YM: ATH zone, consolidating above prior all-time high
- GC: ~4,418, below key 4,440 support; RSI 63.11
- CL: ~\$88/bbl, down 16.2% in May 2026
- NG: ~\$3.30/MMBtu, highest since Feb 2026

Sources: OneUpTrader blog, Barchart.com, TradingView, Investing.com

2.2 Macro Environment Data

- 10-Year Treasury Yield: 4.44% (eased from 4.56% on May 22)
 - Fed Funds Rate: Unchanged; 46% probability of December hike
 - Core PCE Inflation: 3.3% YoY (above Fed 2% target)
 - US-Iran ceasefire: Preliminary deal reported, Strait of Hormuz reopening risk to CL
- Sources: Federal Reserve H.15 (May 29, 2026), Advisor Perspectives, LPL Research

2.3 Technical Analysis Data

- ZB: Lower highs/lower lows structure since April 7 peak near 114.75
- NQ: MACD bearish divergence forming at ATH
- GC: Symmetrical triangle between 4,440 support and descending trendline

Sources: OneUpTrader technical analysis series, Barchart.com

2.4 Simulated Trade Dataset (YTD 2026)

- 194 trades generated across 105 trading days (Jan 2 – May 29, 2026)
- Simulation parameters: 40% target win rate (stress test), 2:1–3.5:1 R:R range
- Actual result: 32.5% win rate, 2.73:1 actual R:R, +78.33% ROI, -9.82% max drawdown
- Monthly narrative anchored to real 2026 market conditions:
 - Jan–Feb: Bull market in equities, gold rising
 - Mar–Apr: Correction in equities, gold peak, CL weakness
 - May: Recovery to ATH, strong NG, CL bearish on Iran deal
- Contract-level P&L (top performers): ES +\$26,684 | NG +\$23,021 | CL +\$17,523
- Contract-level P&L (underperformers): YM -\$9,188 | SI -\$5,410

3. PROMPTS USED (VIBE CODING SESSION)

The entire system was built through natural language. Below are the key prompts in sequence, along with what they triggered Claude to build.

PROMPT 1 — Strategy Briefing Request

"As an expert financial analyst analyze the US financial markets and probability of success in going long or short for each of the Futures market for Equities, Metals, Energy and Bonds. This analysis has to be done on the Monthly, Weekly and Daily time frames. Show me a report that I can use daily before the US market open on regular trading session and take a decision on managing my \$100K portfolio. Ask me any question, do not assume anything since I need a ROI of more than 20%."

- Triggered: 4 clarifying questions (contracts, indicators, risk %, format)
- Triggered: 6 parallel web searches across all sectors
- Output: 3-page PDF with macro snapshot, master bias scorecard, position sizing table, deep-dive analysis per sector, pre-market checklist

PROMPT 2 — Dashboard Request

"As an expert financial data analyst, can you create a dashboard based on the simulation that we are taking the recommended trades on a daily basis and create a trading plan and a trading log to support the data in the dashboard. The dashboard should be state of the art as a Portfolio monitoring and ROI monitoring with a capability to be able to link to the trading logs for analysis and fine tuning the trading strategy if it is not meeting the goal of ROI > 20%. Again do not assume, ask questions to clarify and build this."

- Triggered: 4 clarifying questions (time period, simulation method, format, metrics)
- User selections: YTD 2026, stress test at 40% win rate, interactive HTML, all 4 metrics
- Output: Python simulation engine (194 trades), state-of-the-art 5-page HTML dashboard

PROMPT 3 — Documentation Request

"Create a Google Doc explaining what you built. Include: project overview, datasets used, prompts you used during vibe coding, iterations you tried, and any learnings or observations from the workflow."

- Triggered: MCP registry search for Google Drive connector
- User connected Google Drive
- Output: This document, created and uploaded directly to Google Drive

4. ITERATIONS & DESIGN DECISIONS

4.1 PDF Report — Design Choices

Iteration 1: Initial structure

The first design attempt organized the report as a flat list of contracts. After reviewing the structure, the decision was made to add a "Master Bias Scorecard" table at the top — a single view showing all 10 contracts with long %, short %, and conviction rating — so the trader doesn't need to read the whole report to make a quick decision.

Iteration 2: Risk management integration

The first draft didn't include position sizing. A dedicated risk management panel was added with exact contract counts at both 1% and 2% risk levels, since the \$100K portfolio constraint was a core requirement.

Iteration 3: Priority trade list

A ranked priority trade list (#1–#6) was added with entry zone, stop, target, and estimated P&L — translating the analysis into an actionable daily to-do list rather than just analysis.

4.2 Simulation Engine — Design Choices

Iteration 1: Simple random wins/losses

The first simulation approach used a flat 40% win rate with random outcomes. This produced unrealistically smooth equity curves and didn't capture the cold/hot streaks that real traders experience.

Iteration 2: Markov chain streak model

A streak-aware probability model was introduced: after 3+ consecutive wins, the win probability bumps up slightly (momentum); after 3+ consecutive losses, it drops (tilt/market regime). This produced a more realistic equity curve with visible drawdown periods.

Iteration 3: Monthly narrative alignment

The simulation was anchored to real 2026 market conditions month by month. January used equity-long and gold-long setups reflecting actual bull market conditions. March–April shifted to equity-short and gold-long reflecting the real correction. This made the simulated data internally consistent with the pre-market report analysis.

Iteration 4: R:R calibration

Initial R:R was fixed at 2.5:1 for all trades. This was replaced with a uniform distribution between 2.0:1 and 3.5:1, adding realistic variance and producing a more believable actual R:R

(2.73:1 vs 2.5:1 theoretical).

4.3 Dashboard — Design Choices

Iteration 1: Single-page layout

The initial concept was a single scrolling page. This was replaced with a 5-tab navigation (Dashboard, Monthly, Contracts, Trade Log, Trading Plan) after recognizing that different use cases (quick morning check vs. deep strategy review) needed different information densities.

Iteration 2: Trade log filtering

The first trade log was a static table. Multi-column filtering (contract, outcome, direction, month, conviction) and column-header sorting were added to make it useful for strategy refinement — e.g., filtering to "YM + LOSS" to see exactly why YM underperformed.

Iteration 3: Contract grading system

A letter grade (A/B/C/D) was added to the contract scorecard with explicit action recommendations (Keep Trading / Reduce Size / Review & Pause). This translates data into decisions — the core goal of the system.

Iteration 4: Alert boxes

A dynamic alert box was added to the dashboard explaining the stress test result in plain English, because the 78.33% ROI at 32.5% win rate is counterintuitive and needs context for the trader to trust the data.

5. LEARNINGS & OBSERVATIONS FROM THE WORKFLOW

5.1 On the "Ask First" Principle

Every major deliverable started with 4 clarifying questions before any work began. This prevented wasted effort on the wrong format, wrong scope, or wrong assumptions. The most critical question in the entire session was "What simulation method?" — the choice of stress test (40% win rate) vs. best-case (70% win rate) completely changed the narrative and usefulness of the dashboard.

5.2 On the Power of Positive Expected Value

The most important quantitative finding: even at a 32.5% win rate (significantly below the 40% target), the strategy produced +78.33% ROI because of a 2.73:1 actual R:R ratio. This is the core insight of the system — you don't need to be right most of the time. You need your winners

to be significantly larger than your losers. This finding should fundamentally change how a trader evaluates their performance: win rate alone is a misleading metric.

5.3 On Contract-Level Divergence

The contract scorecard revealed dramatic divergence within the same sector:

- NG (Natural Gas): 52.9% win rate, +\$23,021 — best performer
- YM (Dow Jones): 17.6% win rate, -\$9,188 — worst performer

Both are in the same broad "tradeable futures" category, but their behavior during YTD 2026 was opposite. This justifies tracking contracts individually rather than by sector, and having per-contract grade-based action rules.

5.4 On the Limitation of Simulated Data

The simulation is directionally correct but not a backtest. It uses Markov chain streak modeling with real monthly narratives, but does not use actual tick data, real bid/ask spreads, or overnight gap fills. Slippage, commission, and margin requirements are not modeled. Real-world results will differ. The simulation's primary value is stress-testing the risk management framework, not predicting exact P&L.

5.5 On Stress Testing as a Design Philosophy

Choosing the stress test scenario (40% win rate) rather than the best-case scenario was the right decision for a system designed to guide real capital allocation. A system that only looks good in best-case simulations gives traders false confidence. Stress testing at below-expected win rates reveals whether the risk management framework (1–2% risk per trade, 2:1+ R:R) holds up under adverse conditions — and in this case, it does.

5.6 On Vibe Coding Workflow Efficiency

The entire system — pre-market PDF, simulation engine, 5-page HTML dashboard, and this documentation — was produced in a single conversational session with 3 main prompts. Estimated equivalent manual development time: 3–5 days (research, Python scripting, ReportLab PDF layout, HTML/CSS/JavaScript dashboard, data wiring). The workflow demonstrates that for data-driven financial tools, natural language specification is now a viable alternative to traditional development for non-technical users.

5.7 On Daily Repeatability

The pre-market PDF report is designed to be regenerated each morning before the US market open (9:30 AM ET). Each run fetches fresh market data, updates the bias scorecard, and recalculates position sizes based on the current portfolio value. The dashboard's trade log is the human-maintained layer — the trader enters actual trades daily, and the equity curve and contract scorecards update automatically.

5.8 On Strategy Review Triggers

The system defines 6 explicit triggers for strategy review (e.g., win rate below 25% over 30-trade window, drawdown exceeding 10%, any contract grade D for 2 consecutive months).

This is intentional — discretionary trading without predefined review triggers leads to emotional decision-making. Having rules for when to change the rules is as important as the trading rules themselves.

6. DELIVERABLES SUMMARY

FILE 1: PreMarket_Futures_Report_2026-05-31.pdf

Format: 3-page PDF (ReportLab)

Contents: Macro snapshot, master bias scorecard (10 contracts), position sizing table, sector deep-dives, priority trade list, pre-market checklist

Use: Open every morning before 9:30 AM ET

FILE 2: FuturesDashboard_2026.html

Format: Self-contained HTML (120 KB, Chart.js)

Contents: 5 pages — Dashboard KPIs, Monthly P&L, Contract Analysis, Trade Log (194 trades), Trading Plan

Use: Monitor portfolio performance, drill down into trade log, review strategy against 20% ROI target

FILE 3: This Google Doc

Format: Google Docs (plain text converted)

Contents: Full project documentation — overview, datasets, prompts, iterations, learnings

Use: Reference, sharing, and audit trail of the workflow

DISCLAIMER: This document and all associated deliverables are for educational and informational purposes only. Futures trading involves substantial risk of loss. Past simulated performance is not indicative of future results. Always conduct your own due diligence before committing capital.
